

QA Automation Engineer Home Assignment Pango

This assignment is meant to assess your QA automation skills, QA Methodologies, how you think, prioritize, and approach testing. You'll explore the system, create a focused test plan, automate a key scenario, and briefly explain your decisions.

General Guidelines:

- Focus on demonstrating your **thinking, judgment, and priorities**
- The application contains **bugs** identifying them is part of the task
- You may use any tools you prefer
- You are not expected to cover everything, focus on what you believe matters most

For Submission: Create a public GitHub repository with:

- test-plan.md
- tests/
- README.md
- [test files]
- ai-reflection.md

Please send the repository link within 24 hours of the agreed assignment start time to the following email addresses:

Noa.Ran@pango.co.il, Dori@pango.co.il, yair@pango.co.il

Setup & Run Instructions

Follow the steps below to download and run the Parking Lot Domain application locally using Docker.

- Install **Docker Desktop** 🖱️ <https://www.docker.com/products/docker-desktop>
- Make sure Docker is **running**

Code Block:

```
docker pull --platform linux/amd64 doringber/parking-manager:3.1.0
docker run --platform linux/amd64 -d -p 5000:5000 --name parking-manager
doringber/parking-manager:3.1.0
```

Open: <http://localhost:5000>

Default credentials: admin / password

Part 1 - Exploration & Test Plan

Explore the application and create a test plan that reflects how **you approach testing**.

- What did you choose to test (and why)?
- How did you structure your testing approach?
- What did you consider as an important (risk, edge cases, user flows, etc.)

Include a small, representative set of:

- Test cases (well-structured, not exhaustive)
- At least **5 significant bugs** you identified (*focus on impact, not quantity*)

Deliverable: test-plan.md

Part 2 -Automation

Choose **one or two meaningful scenarios** from your test plan and automate them.

We are interested in:

- Your **reasoning** for what you chose to automate
- Code **clarity, structure, and maintainability**
- A test that **actually runs and provides value**
- How you handle **stability and reliability** (e.g., waits, selectors, test data)

Deliverable:

tests/

README.md # How to run + short explanation of your choices

[test files]

Part 3 -Reflection: Provide a short reflection on your work.

Include:

- Your overall approach and key decisions
- Trade-offs you made and why
- AI tools & technologies you used
- Reasoning behind your tool choices (what they helped with, limitations if any).

Deliverable: ai-reflection.md

We're interested in understanding **how you think**, not just what you did.

Good Luck! 😊
